| Project Name | Metro Ticket Booking System |

#### **Problem :**

##### **Existing Problem**

Metro transportation has become one of the most preferred modes of travel in urban areas due to its speed and convenience. However, many metro stations still rely on traditional ticketing methods, where passengers must wait in long queues to purchase tickets or recharge smart cards. During peak hours, these queues become overcrowded, causing delays and inconvenience. Paper tickets can be misplaced or damaged, while manual fare calculation and ticket verification increase operational effort for metro staff. Additionally, passengers have limited access to digital booking facilities and ticket history.

These challenges reduce operational efficiency and negatively affect the overall travel experience.

## Problems Identified

- Long waiting queues at ticket counters.
- Manual ticket booking process.
- Paper ticket loss or damage.
- Time-consuming fare calculation.
- Slow ticket verification.
- Increased workload for metro staff.
- Lack of digital ticket management.
- No centralized booking history.

## Need for the Solution

A digital metro ticketing solution is required to automate the booking process, reduce passenger waiting time, and improve operational efficiency. By leveraging ServiceNow's automation capabilities, the system can provide a seamless ticket booking experience while eliminating manual intervention.
