

Project Design Phase

Proposed Solution

Date	25 th July 2026
Project Name	Metro Ticket Booking System

Proposed Solution

Overview

The proposed solution is a **Metro Ticket Generation System developed using the ServiceNow platform**. The system digitizes the metro ticket booking process by allowing passengers to book tickets online through the Service Catalog.

Passengers can select the source station, destination station, journey type, travel date, and number of passengers. The system validates the entered details, automatically calculates the fare, generates a unique ticket number, and creates a QR-based digital ticket. Booking details are stored securely in a custom metro ticket table, and confirmation notifications are sent to the passenger.

The solution integrates various ServiceNow components such as Service Catalog, Flow Designer, Business Rules, Catalog Client Scripts, UI Policies, Notifications, and Access Control Lists (ACLs) to automate the complete ticket lifecycle.

Proposed Solution Features

Passenger Module

- Book metro tickets online.
- Select source and destination stations.
- Automatic fare calculation.
- Choose journey type.
- Generate QR-based digital tickets.
- Receive booking confirmation.
- View booking history.

Admin Module

- Manage metro stations.
- Configure fare details.
- Monitor ticket bookings.
- View reports.
- Manage QR validation.

Ticket Verification

- QR code scanning.
- Ticket validation.
- Booking verification.
- Journey confirmation.

Benefits of the Proposed Solution

- Reduces passenger waiting time.
- Eliminates manual ticketing.
- Provides paperless travel.
- Improves ticket verification speed.
- Reduces operational workload.
- Enhances passenger convenience.
- Maintains centralized booking records.
- Supports future digital payment integration.
