

Requirement Analysis Phase

Data Flow Diagrams

Date	25 th July 2026
Project Name	Metro Ticket Booking System

Step 1: Trigger – Service Catalog

Purpose:

The flow starts automatically when a user submits the **Book A Metro Ticket** catalog item from the Service Portal or Service Catalog.

What happens:

- The passenger opens the catalog item.
- They enter journey details such as source station, destination station, journey type, number of passengers, and travel date.
- After clicking **Order Now** or **Submit**, the Service Catalog trigger activates the flow.

Caption: Metro Ticket Booking Flow

Input received:

- Request Number (RITM)
- Requested User
- Catalog Variables
- Request Date
- Catalog Item information

Step 2: Get Catalog Variables from Book A Metro Ticket**Purpose:**

This action retrieves all the variables entered by the passenger in the catalog form so they can be used later in the flow.

Variables typically retrieved include:

- Starting From
- Going To
- Journey Type
- Number of Passengers
- Journey Date
- Ticket Generation Method (QR/Manual)
- Fare Amount
- Passenger Name (if applicable)
- Contact Details
- Travel Time (if included)

Why this step is needed:

The Service Catalog stores user inputs as catalog variables. Before creating a record in another table, the flow must fetch these values.

Step 3: Create Metro Database Record

Purpose:

This action creates a new record in your custom Metro Ticket table.

What happens:

The values retrieved in the previous step are mapped to the corresponding fields in the Metro Ticket table.

Example Field Mapping

Metro Ticket Table Field	Value from Catalog
Passenger Name	Requested For
Starting From	Starting From variable
Going To	Going To variable
Journey Type	Journey Type variable
Number of Passengers	No. of Passengers variable
Journey Date	Journey Date variable
Fare	Calculated Fare
Ticket Generation Method	QR / Manual
Booking Status	Confirmed
Ticket Number	Generated later
QR Value	Generated later

Output : A new booking record is successfully stored in the database.
